

DOW Sverige – Norrkoping, Sweden

Track Mounted Gangway

2008

Loadtec were contacted by Dow to provide a method of tanker access so that visiting tankers could pull alongside a new platform facility and open/inspect any number of manlids on the tanker top.

Dow had identified that many tanker drivers were climbing up onto their tanker tops, without the benefit of fall protection, to carry out this task adjacent to the loading and unloading spots.

Loadtec worked with Dow to design a **Track Mounted Gangway System** that would allow all tankers visiting the site to use the access facility.

The system was built by Carbis Inc in South Carolina, USA and supplied in a 20' container direct to site, where it was unloaded and installed by Dow contractors. The installation instructions provided were simple to follow and precise manufacturing made the assembly an effortless task.

Johan Axby, Dow Project Engineer comments *“The Carbis Fall Protection System works well and is actually used for access onto trucks that are not unloading at this station. Drivers go there voluntarily to open ventilation and then drive from there to their unloading spot rather than attempting to climb their own access ladders. A good reference for a safety system is if it is used even without people being pushed, as all people tend to like shortcuts”.*

If you would like to find out more about how Loadtec can resolve your Fall Prevention issues then please do not hesitate to contact us.
